

10 pts - HW01 Home Page

I got 10/10, but had a comment to add the FK to web_user_id to the blog. I have added this

10 pts - HW02 Database

I got 10/10

10 pts - HW03 Single Page Application

I got 10/10

10 pts - HW04 Components

I got 7/10

TA Comment: -3: per user event (2 required). Not done and/or does not work (must change a property and the UI must reflect that change). One of the events needs to do a calculation on the non character property. The other can be a simple setter. -3: per user event (2 required). Not done and/or does not work (must change a property and the UI must reflect that change). One of the events needs to do a calculation on the non character property. The other can be a simple setter.

Professor Comment: +3 I just noticed your "click for review" (it didnt look like a link or a button so I guess I overlooked it). This counts for 1 event out of the two (you need for JS and react), but you do need to have the other event modify the data members of the object being represented by the component.

I have since added my second event. It incorporates buttons that will increase or decrease the latitude or longitude value by increments of 1 on click. This in addition to the already existing event that I had, the on click for the "click to show review"

10 pts - HW05 Web APIs

I got 10/10

10 pts - HW06 ShowData

I got 7/10

TA Comment: webUser list and other filterable does not work after searching once and then searching nothing as value should return back whole table notes: on first

render the leftmost column should already be sorted Other -1: "other" data does not show at least one non key field joined from web_user (e.g., user_email or user_image).

Professor Comment: -2: webUser list and other filterable does not work after searching once and then searching nothing as value should return back whole table notes: on first render the leftmost column should already be sorted Other -1: "other" data does not show at least one non key field joined from web_user (e.g., user_email or user_image).

I have fixed the searching nothing issue. I have fixed the on render, should be sorted. I originally had it sorted by the primary key, now it is sorted by the date, which is the leftmost column. I have also fixed the non key field from user, I have added the email.

20 pts - HW07 Insert

I got 18/18 on canvas, so full score, but there were comments

TA Comment: You should include a link to your insertOther under Account in the nav bar as well. - 1: if "other" display does not show the at least one non-key field from web_user table (e.g., email address and/or picture of the user). -1 should have a field level error when I input nothing for ticket date (db error catches this because it is not nullable)

Professor Comment: make sure you have two nullable non character fields. If you need ticket data as nullable, the fix your issue by making the date nullable in the DB (rather than adding the field level error as suggested by tim).

I clarified with the professor that there should NOT be an insertOther under account in the nav bar. I did however fix the field level error, it now shows an error. I also have the db requirements.

15 pts - HW08 Logon

I got 15/15

20 pts - HW09 Update

I got 20/20

Professor Comment: hi daniel, try to work on your layout a bit. In the HTML tables, the sort icons are not the same size. Probably use a sans-serif font and a little

smaller. For columns with narrow data but long headings, you could use a `
` to create two line heading.

I have since worked on the CSS and it now renders cleanly.

10 pts - HW10 Delete

This is currently ungraded
